

## FILM GRAIN

Here is a simple way to add Film Grain as a layer of texture over the image layer. This is totally controllable and editable, much better than using the Film Grain filter.

add a layer [CMD] [SHFT] N  
name it 'grain'  
set blending mode to 'hard light'  
fill with 50% grey

fill the layer with noise  
**FILTER > NOISE > ADD NOISE**  
adjust **AMOUNT**  
to your satisfaction  
set **Distribution**  
to **Gaussian**  
turn on **Monochrome**

adjust the **OPACITY** of the layer  
to get desired effect (subtle)
